

Stripe Payments API v3 Integration Manual

1. OAuth 2.0 Security & Tokens

Stripe API uses OAuth 2.0 Bearer tokens for authenticating request calls over HTTPS. Never expose secret keys in client-side code.

```
Authorization: Bearer sk_test_51Mz08aB9xQ2L7m
Stripe-Version: 2026-08-01
```

2. Creating a Refund (/v3/refunds)

HTTP Method: POST URL: <https://api.stripe.com/v3/refunds>

Request Parameters:

- **charge_id** (required): ID of the charge to refund.
- **amount** (optional): Amount in cents to refund. If omitted, full amount is refunded.
- **reason** (optional): One of duplicate, fraudulent, or requested_by_customer.

```
{
  "charge_id": "ch_3M01a92e",
  "amount": 500,
  "reason": "requested_by_customer"
}
```

3. Rate Limiting & Retry Policy

API rate limit is 100 requests per second in test mode and 500 requests per second in production. Exceeding limits returns HTTP 429 Too Many Requests.

Use exponential backoff with jitter when retrying failed requests.
